TITLE: Automation of the CO₂-shielded welding of tubes and flat-plate structures.

SOURCE: Avtomatizatsiya protsessov mashinostroyeniya. t.2: Goryachaya obrabotka metallov. Moscow, Izd-vo AN SSSR, 1962, 222-226.

TEXT: Gas-shielded arc welding with a consumable electrode can be automated readily for any desired position in space and for welding of both rotating and nonrotating pipes. The 1956 method of automatic arc welding of rotational butt welding of pipes with back-up rings, developed by the welding lab of the MVTU (Moscow Higher Technical School) imeni Bauman, is described. Welding (WG) was done simultaneously with two electrode wires - a split electrode. A jet of CO₂ protected the WG zone. The WG arc was displaced from the zenith of the tubes being welded against their sense of rotation, so that the arc process would occur above a protective layer of molten metal. The two electrode branch wires could be placed across the WG gap in wide gaps and along it in narrow gaps. Pipes up to 6-mm thick were welded in a single pass (i.e., a single rotation of the pipes); thicker pipes required additional passes. The absence of flux facilitates observation of the weld and accelerates the crystallization of the metal in the WG bath; hence, WG of small-diam pipes becomes possible. Optimal electric parameters (generator characteristics) and the mechanical properties of the weld material obtained are summarized. X-ray photographs

TOPIC TAGS: welding, automatic welding, radioactive isotope

ABSTRACT: An experimental investigation is reported of "the possibility of developing a follower system for a butt and resetting unit that would be a part of the automatic welding-control system." Various tracks of development are discussed. The investigated primary element includes a radiation source and a receiver, and responds to lateral-butt deviation and to deviation of the weld width and thickness from set values. A self-quenching gas counter was selected for sensing the radiation. Data illustrating the sensitivity of MS-12, MS-13, STS-1.

and STS-5^A gas counters is supplied, as well as characteristics of an ionization differential primary element based on MS-13 counters. Block diagrams of the follower and the automatic welding-control system are presented and discussed; only open-type (with gaps 0.1-0.3 mm) butt welds are held possible. TITLE: The effect of manganese on weld properties during welding in carbon dioxide

SOURCE: Svarochnoye proizvodstvo, no. 8, 1965, 23-24

TOPIC TAGS: weld property, arc welding, welding wire/ Sv 08G2SA welding wire,
PGSh 4 welding machine 14

ABSTRACT: To determine the effects of increased Mn content in Sv-08GSA and Sv-08G2SA electrode wires (recommended for welding of low carbon and low alloy steels in a carbon dioxide atmosphere) on the welded seam properties, 12-mm thick specimens of boiling (C = 0.21%, Mn = 0.37, P = 0.038, S = 0.027, Cr = 0.13, Ni = 0.07) and dead melt (0.16, 0.49, 0.033, 0.034, 0.08, 0.18 respectively) steel were semiautomatically welded on machine PGSh-4 (I = 450 amp, U = 30-32 V, 280 m/hr, Q_{gas} = 1200 liter/hr) in a CO₂ atmosphere. The properties of the welds were investigated as a function of Mn content in the electrode wire. Wire Sv-08G2S (GOST 2246-60) was used with 1.64-2.14% Mn (0.7 C, 0.78 Si, 0.021 P, 0.025 S). It was found that as the Mn content in the wire increased from 1.64-2.1% the Mn content in the weld and the Mn

Card 1/2

3

burn-off both increased (0.8-1.0% and 0.9-1.1% content, and 0.3-0.5% burn-off for boiling and dead melt steels respectively). The strength and bending properties of the welds are satisfactory over the range of Mn content investigated (pores are completely eliminated with Mn > 2.0%), but the weld deteriorates for Mn > 2.1%. The impact strength of the weld varies slightly over the range and is sufficient. It is established that the whole range of Mn content (1.8-2.1%) specified by GOST 2246-60 for wire Sv-08G2S gives satisfactory welds. Orig. art. has: 5 figures.

TITLE: Stability of welding arc in a transverse magnetic field

SOURCE: Svarochnoye proizvodstvo, no. 10, 1965, 6-9

TOPIC TAGS: arc welding, transverse magnetic field, welding arc stability,
welding electrode

ABSTRACT: The possibility of controlling the stability of the welding arc by means of a transverse magnetic field is markedly restricted by the arc's inability to elongate without disrupting when deflected by such a field. It is shown that this restriction may be to a large extent eliminated by stabilizing the arc by means of the flow of the protective gas. This results in equalizing the plasma velocity field and increasing the total velocity of the cathode flow and thus in deforming the arc as a single whole, particularly in the upper (near-cathode) region of the column. Another method of stabilizing the arc is the employment of the so-called "directing wall". In this case, the arc discharge moving in a commercial-frequency transverse magnetic field is bounded by two graphite or cooled copper blocks (see Fig. 1 of the Enclosure). A tungsten electrode and the protective gas are passed through the space between the blocks. The flow rate of the argon is 7-8 liters/min, which precludes

Card 1/3

L 3271-66

ACC NR: AP5025607

compression of the arc by the gas flow. The directional profile of the block is parabolic, thereby maximizing the displacement of the anode spot. The device stabilizes the flame so that the anode flow bounces from the walls and is directed counter to the cathode flow, thus displacing the anode spot. Orig. art. has: 11 figures.

TITLE: Effect of welding on the corrosion properties of titanium
(BT1-1) units 27,44,55

SOURCE: Svarochnoye proizvodstvo, no. 12, 1965, 9-10

TOPIC TAGS: electron beam welding, arc welding, argon, titanium, corrosion rate, corrosion resistance, solid mechanical property

ABSTRACT: The corrosion properties of welded units made of BT1-1 titanium (0.08% Fe, 0.04% Si, 0.05% C and 0.0007% H₂) were studied. The mechanical properties of the titanium sheet were $\sigma_{0.2} = 52 \text{ kg/mm}^2$, $\sigma_{0.2} = 41 \text{ kg/mm}^2$, elongation = 39%, RA = 51% and bend angle = 180°. Conditions are given for argon arc and electron beam welding. Current and voltage were constant (130 amps, 11 v for argon arc and 50 amps, 18 v for electron beam welding) while welding speed varied from 13.3 to 30 m/hr and the linear heating rate from 226 to 510 cal/cm² sec for argon

UDC: 621.791.052.004.12.011:669.295.5

Card 1/3

L 13073-66

ACC NR: AP6000615

arc welding; for electron beam welding, these were kept constant at 20 m/hr and 362 cal/cm² sec. For argon arc welding, the temperature distribution in the weld zone was given as a function of distance from the weld and of time. The temperature and linear heating rate was observed to rise as welding speed decreased. The result was a greater seam width and a more extensive heat-affected zone. The above mentioned mechanical properties were determined for welds made at different speeds. The cross section of the samples was 15 x 2 mm. The only mechanical parameter significantly affected by the change in welding speed was the bend angle. For argon arc welding, the optimum speed was 20 m/hr. Higher speeds caused quenching while lower speeds produced an enlarged grain size. With electron beam welding, the heat-affected zone was smaller and the plastic properties were better. Since residual stresses decrease corrosion resistance in aggressive media, these stresses were determined as a function of distance from the weld. The maximum value was obtained at the weld and subsequently dropped off, becoming zero at about 20 mm and compressive above 20 mm. The stresses were obtained with a mechanical tensometer according to the MVTU method. It was found that the residual stress depended neither on the operating conditions nor on the method of welding. For the corrosion tests, two types of media were used: 20% HCl solutions at room temperature and

Card 2/3

L 13073-66

ACC NR: AP6000615

3.5% HCl solutions at 80°C, as well as 2.5% Br, 15% H₂O and methyl alcohol as remainder. The corrosion test samples were evaluated by bend testing, by the general rate of corrosion and by resistance to corrosion cracking during uniaxial bending. The differences in operating conditions were compared and little change in bend properties or corrosion cracking was noted between the welding methods. However, the weld region generally cracked more than the heat-affected zone or the base metal itself. Moreover, corrosion rate was greater in the weld seam. Macrographs showing corrosion cracking were presented to illustrate the lower crack resistance of the weld. Orig. art. has: 7 figures, 1 table.

TOPIC TAGS: butt welding, automatic welding, welding technology/ Sv-08G2S electrode wire, St3 steel		
ABSTRACT: To improve the quality of butt welding of nonrotating low-carbon steel pipes, a method which uses lateral oscillations of the welding electrode was developed at MVTU (A. I. Akulov and V. V. Spitsyn. Svarka trub v uglerodistom gaze s poperechnymi kolebaniyami elektroda. Svarochnoye proizvodstvo, 1960, No. 9). Low-carbon steel pipes (195 x 6, 219 x 8, and 273 x 8 mm diameter) with V-shaped butts were welded with Sv-08G2S electrode wire. The root welds (with 2-mm clearance) were performed with a vibration amplitude of 6--8 mm and 40--90 cpm and the finishing welds with an amplitude of 12--14 mm (to cover the V-opening). Curves of welding current as a function of electrode speed (0--40 m/hr) are presented and sections at different positions in the butt weld are shown. To determine the strength of the

TITLE: Special characteristics of automatic welding in carbon dioxide
with a split electrode

SOURCE: Svarochnoye proizvodstvo, no. 6, 1966, 31-33

TOPIC TAGS: automatic welding, carbon dioxide, welding electrode

ABSTRACT: The article constitutes a review of the industrial possibilities of welding in carbon dioxide with a split electrode. In present day welding practice, it is common to use one-side welding for tube joints and sheet joints. In such cases, the quality of the welded joint is determined by the quality of the root of the seam. It has been found that welding with a split electrode guarantees the stability of the mechanical properties of the welded joint. This is illustrated by photographs in the article. In general, it is concluded that the formation of the welded seam, the regulation of the depth of fusion along the axis of the seam, and the burning stability of the arc, in

masum showed evidence of hypoxemia. The mucosa glands indicated degeneration and necrobiosis, while the connective tissue base was infiltrated with lymphoid and plasmatic cells with a small admixture of eosinophils. In some areas of the mucosa, the cell infiltration was so manifest that it obscured the contours of the glands. In addition, in separate areas mucosa was necrotized and perforated with hemorrhages. The sharpest changes were noted in the duodenum and jejunum. The mucosa of the latter was almost completely deprived of tectorial epithelium. The

TITLE: Formation of fluorine-containing compounds of xenon during β -radiation of Xe^{131} contained in iodine pentafluoride

SOURCE: Radiokhimiya, v. 7, no. 5, 1965, 629-630

TOPIC TAGS: xenon, fluorine, beta radiation, iodine, elemental halogen, fluorine compound, radioisotope

ABSTRACT: Free Xe^{131} was accumulated by bubbling helium for 8 hours at room temperature through a liquid $I^{131}F_5$. The origin of this free Xe^{131} is traced to the intermediate formation of a molecular ion $[Xe^{131}F_5]^+$. After removal of free Xe^{131} , the β -radiation material was hydrolyzed and the products of hydrolysis were subjected to reduction with various reducing agents. In the course of treatment with HCl the xenon-fluorine compounds were reduced to free xenon. No free xenon was obtained when KJ, hydroxylamine, or Fe^{2+} were used as reducing agents. It was found that

TOPIC TAGS: corrosion protection, protective coating, silicate, water supply system

ABSTRACT: The use of a silicate anticorrosive coating is recommended in water supply (for protection of water-carrying pipes) since it does not affect the organoleptic properties of water or its chemical and bacterial composition. The silicate coating contains: liquid glass, water, ZnO, powdered chamotte, and iron ocher. N. P. [Translation of abstract].

TITLE: Analytical expression for the dependence of the density of liquid oxygen on temperature and pressure

SOURCE: Inzhenerno-fizicheskiy zhurnal, v. 9, no. 6, 1965, 802-803

TOPIC TAGS: thermodynamic property, liquid oxygen, fluid density, temperature, pressure

ABSTRACT: The article proposes an approximate relationship between the density ρ , temperature T , and pressure p of liquid oxygen. Data from the literature were processed by the method of least squares. For the determination of the density of liquid oxygen in the temperature range from 153 to 83 K at pressures of $(78.5 - 196) \times 10^5 \text{ N/m}^2$, the following analytical relationship is recommended:

$$\rho = a_0 + a_1 \left(\frac{T}{100} \right) + a_2 \left(\frac{T}{100} \right)^2;$$

Card 1/2

UDC: 532.10+532.14

J 11244-66

ACC NR: AP6002004

$$a_0 = 1,48472 - 0,08545 \left(\frac{1}{p} \right) \cdot 10^7 - 0,06936 \left(\frac{1}{p} \right)^3 \cdot 10^{14};$$

$$a_1 = -0,3210 + 0,27106 \left(\frac{1}{p} \right) \cdot 10^7 + 0,096632 \left(\frac{1}{p} \right)^3 \cdot 10^{14};$$

$$a_2 = -0,000412 - 0,25723 \left(\frac{1}{p} \right) \cdot 10^7 - 0,0026284 \left(\frac{1}{p} \right)^3 \cdot 10^{14}.$$

results calculated by this relationship gave satisfactory agreement with experimental data. The largest error was at temperatures of 153-153K.. and pressures of $(78.5 - 98.0) \times 10^5 \text{ N/m}^2$. For the other regions, the deviation was less than 1%. Orig. art. has full table. [06]

AUTHOR: Akulov, L. A.; Novotel'nov, V. N.ORG: Leningrad Technological Institute of the Refrigeration Industry (Leningradskiy tekhnologicheskiy institut kholodil'noy promyshlennosti)TITLE: Temperature and pressure dependence of the density of liquid nitrogenSOURCE: Zhurnal fizicheskoy khimii, v. 40, no. 3, 1966, 708-709

TOPIC TAGS: liquid nitrogen, fluid density, temperature dependence, pressure

ABSTRACT: An equation is proposed for determining the density of liquid nitrogen in the temperature range of 78-133°K and pressure range of (50-500) 10⁵ n/m². In order to obtain the dependence in its simplest form, an attempt was made to correlate the density and temperature by the quadratic relation

$$\rho = a_0 + a_1(T/100) + a_2(T/100)^2,$$

where a_0 , a_1 and a_2 are pressure-dependent coefficients. In finding these coefficients, best results are obtained with a logarithmic dependence of the form $a = A + B \log p + C(\log p)$, which permits one to obtain the density with a high accuracy for practical applications. In their final form, the expressions for determining coeffi-

UDC: 533.12

Card 1/2

4701. Theory of Dependence of Ferromagnetic Properties of Metals on Temperature. N. Akulov. *Comptes Rendus (Doklady) de l'Acad. des Sciences, U.S.S.R.*, 1937, pp. 448-450, 1937. In English.— Ferromagnetic crystals are today regarded as consisting of areas of spontaneous magnetisation. The structure of these areas is not yet clear and a simple pattern is suggested which permits development of the theory of the dependence of ferromagnetic phenomena on temperature. Each area of spontaneous magnetisation with resultant spin J_s is, under the action of temperature, divided into a group of smaller areas having the moment $J_0 > J_s$ (J_s = saturation at absolute zero). The spins J_0 precess about J_s at different angles λ_m representing the functions of temperature, viz., $J_s = J_s \sum W_m \cos \lambda_m$, where W_m is the probability of precession at the angle λ_m ; if a be a parameter characterising some electric, magnetic or mechanical property of the metal at absolute zero, then the value of this parameter may be deduced at any temperature between absolute zero and the Curie point. It is shown how the method may be applied to the deduction of laws for the effect of temperature on the curves of magnetisation of crystals (parallel and normal components), magnetostriction, mechanostriction, thermomagnetic effect, influence of tension on magnetisation curves, Thomson effect and the galvanomagnetic effect. The demonstration of the truth of the principle of equivalence at low temperatures (enunciated by the author) is also possible. H. J. H. S.

On the Determination of the Thickness of Protective Coatings. N. S. Anufriev (Vestn. Metallopros. (Metal Ind. Herald), 1939, 19, (1), 78-80; Chem. Zern., 1940, 111, (11), 268).—[In Russian.] A magnetic testing apparatus is described for determining the expenditure of energy required to remove a coating (e.g. nickel). On the basis of the expenditure of energy, registered automatically, the thickness of the coating may be calculated from a simple formula. The apparatus is in pocket form and may be usefully applied in industry for the usual thicknesses of coatings of 0.50μ .
